Q: ASP.NET Global Cache for different data sources I want to use ASP.NET cache to make sure that different data sources are consistent. For instance, I want to store cached object in a way that it contains information from a database, but from the cache it also contains information from a web service. When the user goes back to the database, it should be automatically copied into the cache. I hope that makes sense. So I'm curious to know how this can be done. I've done this before, but I want to be sure I don't have any potential gotchas. Also, I've been away from ASP.NET for a while so I'm rusty. A: Typically, you would have 2 cache providers that you use for different purposes. You would put your object cache in the web.config and then a custom cache like the System.Web.UI.Cache control that can cache the results of an ajax call. A custom cache lets you control the content via its own cache so you don't have to worry about whether the data is in a database, a web service, etc... The ASP.NET cache is best when you have a central cache with some data that is not being used. Typically, you don't use it for data that is used for the page loads, because the data in your cache is stale. Use the custom cache for data that you need for the page load and for long running calls to data that may take awhile. Electric Skyfish The Electric Skyfish (also known as the Thunder Pogo or Space Pogo) is a small electric powered unicycling sport developed in 2013 by Rich Marsh and Rob Crampton of British Columbia, Canada.
