Anemia due to inadequate erythropoietin production by the kidney in patients with renal failure (nephrogenic anemia) may be important in the pathogenesis of the complications associated with this disorder such as cardiovascular disease and increased susceptibility to infection. Anemia may be caused by impaired responsiveness to erythropoietin or by inadequate erythropoietin production. The latter may be caused by a relative increase in the rate of erythropoietin catabolism due to reduced numbers of erythropoietin-responsive bone marrow cells. It is not known whether the decrease in erythropoietin-sensitive cells is due to increased erythropoietin catabolism or deficient cell division. The proposed study will measure the dose-response of erythropoietin in stimulating the proliferation of erythropoietin-responsive cells in anemic patients on maintenance hemodialysis and in normal subjects. This will be done in order to determine whether decreased responsiveness of erythropoietin-sensitive cells in these patients can be corrected by increasing the dose of erythropoietin. If the responsiveness of bone marrow cells to erythropoietin is decreased in patients with end-stage renal failure, then it is likely that the development of the anemia cannot be improved by increasing the dose of erythropoietin. If the dose-response of erythropoietin is the same in patients as in normal subjects, then in these patients, the anemia cannot be corrected by increasing the dose of erythropoietin. If the responsiveness of erythropoietin-sensitive cells is increased in these patients, then the anemia can be improved by increasing the dose of erythropoietin, and erythropoietin dose can be further increased without deterioration of the anemia.was born on september 10, 1984 in New York. he is one of three children. his father, bob, is a successful business 6d1f23a050
